Universe may have other civilisations

MOSCOW, Feb. 3.—The President of the Soviet Academy of Sciences said on Friday he did not exclude the possibility of other civilisations in the universe, says AFP.

In the newspaper Tass quoted by Tass today, atomic physicist Anatoli Alexandrov said: "The present level of science does not permit us to confirm or deny the existence of an extra-terrestrial civilisation."

"In the vast universe there are a sufficient number of planetary systems. It is completely possible that some stars have natural conditions close to those of earth suitable for the development of life."

"All that is possible but we cannot say either 'yes' or 'no', he added.

Radio signals received on earth were being continually studied. Everything received or recorded has a natural explanation and for the moment there was no like with such a civilisation.
